Data Engine Administration: Audit Log

Introduction

Audit Logging enables administrators to identify all administrative actions and system events, providing visibility into user activity across the system and helping identify who, what, and when something was altered.

There is a variety of filters avaiable to administators such as:

- Start Date,
- Finish Date,
- Event Type,
- Feature Type,
- User(s),
- Organisation(s).

In addition, administrators have access to a table of the latest actions taken by users, providing transparency into system activity and supporting accountability, traceability, and security best practices aligned with standards such as ISO/IEC 27001.

> Administrators can export audit data as a CSV/JSON to use for further anaylsis.
